Grade 8: Connecting Research to Outcomes in a Changing Climate

<table>
<thead>
<tr>
<th>Stage 1 – Desired Results</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Outcomes and Indicators:</strong></td>
</tr>
<tr>
<td>Continue the study of plant phenology (initiated during grades 6 and 7) by continuing with and augmenting the previous years’ research project.</td>
</tr>
<tr>
<td>Explore the variety of microclimates on the school campus by investigating temperature, relative humidity, and light availability across the campus.</td>
</tr>
<tr>
<td>Test potential plant habitats using the microclimates identified on the school campus by growing native seeds and examining germination and growth measures.</td>
</tr>
<tr>
<td>Understand the importance of research in helping find solutions to future impacts of climate change by interacting with a SEGA researcher from NAU/The Arboretum and designing a SEGA experiment.</td>
</tr>
<tr>
<td>Identify how changes in the timing of plant phenology can impact animal populations by analyzing historical data of the pied flycatcher and by making inferences based upon that data.</td>
</tr>
<tr>
<td>Explore actions humans can take to minimize their impact on climate change by reviewing a list of steps provided by The Arboretum and by understanding the implications of each step.</td>
</tr>
<tr>
<td>Assist The Arboretum at Flagstaff by designing interpretive signs for SEGA research projects or the phenology project to be used for public education.</td>
</tr>
</tbody>
</table>

| Understandings: |
| *Students will understand that...* |
| Scientific research is a complex process that requires careful attention to detail, proven research methodology, and accuracy in collection of data. |
| Plants and animals adapt to life within an ecosystem but some may not be able to adapt if the environment or climate changes too rapidly. |
| When studying an issue, scientists interpret data and evaluate evidence using the skills of observation, questioning, inferring, and communicating. |
| Humans can minimize their carbon footprint through conscious decisions. |

| Essential Questions: |
| *Students will ask such questions as...* |
| How do scientists conduct their research? |
| How do we know their results and conclusions are valid? |
| What happens to organisms living within a specific ecosystem if that ecosystem changes in response to a changing climate? |
| What does a scientist do? |
| How can humans mitigate their carbon footprints? |

| Knowledge: |
| Skills: |

*Expanding the Depth and Breadth of Climate Change Common Knowledge: Using Research Gardens as a Common Thread*
### Grade 8 At-a-Glance

**Students will know . . .**

- Scientific research is a long-term process that requires carefully honed skills.
- Plant and animal species generally require many generations to evolve. Individuals may or may not be able to adapt to new and changing environmental conditions.
- Scientists must carefully examine their data to ensure reliability and accuracy when investigating an issue or testing a hypothesis.
- SEGA is a long-term ecological research instrument that can help scientists better understand how plants will respond to a changing climate.
- Communicating the results of an investigation is of primary importance to the scientific community.

**Students will be able to . . .**

- Observe and record the phenology of a plant or plants within the Flagstaff area
- Examine microclimates on the school campus
- Develop questions to guide their research
- Organize data into logical tables, columns, charts, graphs, or other visual displays
- Identify variables that may impact the timing of a plant’s phenology
- Make inferences about how a changing climate in Flagstaff might affect plants or other organisms that depend upon those plants
- Hold informed discussions on what it means to mitigate for climate change impacts

### Key Vocabulary:

Note for teachers: it will be important that students review vocabulary introduced during grades 6 and 7:

Vocabulary for grade 8:

- **Carbon footprint** - A carbon footprint is the measure of the environmental impact of a particular individual or organization's lifestyle or operation, typically measured in units of carbon dioxide (and other greenhouse gases) emitted per year

- **Citizen Science** - is a strategy used by scientists to help augment their body of data and evidence through the training and networking of volunteers who use tested protocols for assisting in a scientific data collection

- **Hygrometer** – a device for measuring humidity

- **Microclimate** - the climate of a very small or restricted area, especially when this differs from the climate of the surrounding area

- **Migration** – movement from one place to another (usually to find the best food supply and not to avoid changes in temperature)

- **NDVI (Normalized Difference Vegetation Index)** – a measurement of how much photosynthesis is occurring at the Earth’s surface

---

*Expanding the Depth and Breadth of Climate Change Common Knowledge: Using Research Gardens as a Common Thread*
Photometer – a device for measuring light availability

Relative humidity - the amount of water vapor present in air expressed as a percentage of the amount needed for saturation at the same temperature

Variable – something that can vary or change

<table>
<thead>
<tr>
<th>Stage 2 – Assessment Evidence</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Performance Tasks:</strong></td>
</tr>
<tr>
<td>The following are continuing from grades 6 and 7:</td>
</tr>
<tr>
<td>Student log/journals/graphs kept up to date with accurate data, organized so the student may readily extract information</td>
</tr>
<tr>
<td>Established protocols used consistently for gathering and recording data and evidence</td>
</tr>
<tr>
<td>Frequent data collection indicated within journal/log</td>
</tr>
<tr>
<td>Completion of required elements in the ongoing phenology study (data and evidence in journals).</td>
</tr>
<tr>
<td>Additional for grade 8:</td>
</tr>
<tr>
<td>Collect, analyze, and chart data from a school campus investigation</td>
</tr>
<tr>
<td>Design an interpretive sign for a SEGA research project or the phenology project.</td>
</tr>
<tr>
<td><strong>Other Evidence:</strong></td>
</tr>
<tr>
<td>On task with questions</td>
</tr>
<tr>
<td>Demonstrates enthusiasm for learning</td>
</tr>
<tr>
<td>Individual motivation and group cooperation</td>
</tr>
<tr>
<td>Active participation in all class activities</td>
</tr>
<tr>
<td>Contributes to class discussions individually and as part of a small group</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Stage 3 – Action Plan</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Learning Activities:</strong></td>
</tr>
<tr>
<td><strong>NOTE:</strong> Students will continue the long-term phenology project launched in grade 6 and continued in grade 7. Project may expand to include additional species, depending upon the enthusiasm and self-direction of students.</td>
</tr>
</tbody>
</table>

- **Engage** Guiding question: “How much do microclimates vary across my school campus?”
  Students explore microclimates for plant growth within their school campus by mapping and documenting temperature, relative humidity and light availability across their campus.
  Extension: Add instruments like an anemometer (wind speed), soil probes (pH, soil moisture) or data loggers to more deeply explore differences in microclimate.

- **Explore** Guiding question: “What microclimate provides the best growing conditions for plants?”
  Students analyze their microclimate data and test sites by germinating and growing native seeds.
**Grade 8 At-a-Glance**

**Last Updated: December 1, 2015**

**Explain**  Guiding question: “What is SEGA and how is it being used to study climate change?”

Students identify the role of the SEGA Project to the ecological future of northern Arizona and compare their own research with that of the scientists.

Extension: Plan a field trip to The Arboretum to see the SEGA gardens and research projects, the state-of-the-art weather station, the I-STEM Learning Center and Climate Change Exhibit.

**Elaborate**  Guiding question: “Right place, wrong time…or right time, wrong place?”

Students contemplate the ecological and phenological connections between oak leaves, caterpillars, and Pied flycatchers in Spain. (Ch. 8 Right Place, Wrong Time in *Climate Change from Pole To Pole* – NSTA)

**Evaluate**  Guiding question: “What can we do to help our native plants survive long-term changes in climate?”

Students create interpretive signage for a SEGA research project or the phenology project.
### Connecting Research to Outcomes in a Changing Climate

#### Grade 8: Arizona Academic Standards, Framework for K-12 Science Education, and Climate Literacy Principles

</thead>
<tbody>
<tr>
<td><strong>Scientific and Engineering Practices</strong></td>
<td><strong>Science</strong></td>
<td>3. Life on Earth depends on, is shaped by, and affects climate.</td>
</tr>
<tr>
<td>1. Asking questions (for science) and defining problems (for engineering)</td>
<td>S1C1PO2. Select appropriate resources for background information related to a question, for use in the design of a controlled investigation.</td>
<td>A. Individual organisms survive within specific ranges of temperature, precipitation, humidity, and sunlight. Organisms exposed to climate conditions outside their normal range must adapt or migrate, or they will perish.</td>
</tr>
<tr>
<td>2. Cause and effect: mechanism and explanations</td>
<td>S1C2PO1. Demonstrate safe behavior and appropriate procedures (e.g., use and care of technology, materials, organisms) in all science inquiry.</td>
<td>B. Changes in climate conditions can affect the health and function of ecosystems and the survival of entire species. The distribution patterns of fossils show evidence of gradual as well as abrupt extinctions related to climate change in the past.</td>
</tr>
<tr>
<td>3. Planning and carrying out investigations</td>
<td>S1C2PO4. Perform measurements using appropriate scientific tools (e.g., balances, microscopes, probes, micrometers).</td>
<td>C. Climate varies over space and time through both natural and man-made processes.</td>
</tr>
<tr>
<td>4. Analyzing and interpreting data</td>
<td>S1C1PO5. Keep a record of observations, notes, sketches, questions, and ideas using tools such as written and/or computer logs.</td>
<td>A. Climate is determined by the long-term pattern of temperature and precipitation averages and extremes at a location. Climate descriptions can refer to areas that are local, regional, or global in extent. Climate can be described for different time intervals, such as decades, years, seasons, months, or specific dates of the year.</td>
</tr>
<tr>
<td>5. Using mathematics and computational thinking</td>
<td>S1C3PO1. Analyze data obtained in a scientific investigation to identify trends.</td>
<td>B. Climate is not the same thing as weather. Weather is the minute-by-minute variable condition of the atmosphere on a local scale. Climate is a conceptual description of an area’s average weather conditions and the extent to which those conditions vary over long time intervals...</td>
</tr>
<tr>
<td>6. Constructing explanations and designing solutions</td>
<td>S1C3PO2. Form a logical argument about a correlation between variables or sequence of events (e.g., construct a cause-and-effect chain that explains a sequence of events).</td>
<td>6. Human activities are impacting the climate system.</td>
</tr>
<tr>
<td>7. Engaging in argument from evidence</td>
<td>S1C3PO5. Explain how evidence supports the validity and reliability of a conclusion.</td>

- ESS3.C: Human Impacts on Earth Systems
- ESS3.D: Global Climate Change

- histogram
- S1C4P03. Present analyses and conclusions in clear, concise formats.
- S1C4P05. Communicate the results and conclusion of the investigation.
- S2C2P01. Apply the following scientific processes to other problem solving or decision making situations:
  - Observing
  - Questioning
  - Communicating
  - Predicting
  - Organizing data
  - Inferring
  - Generating hypothesis
  - Identifying variables

NOTE: Classifying is a part of this PO but is not addressed in this lesson.
- S2C2P03. Defend the principle that accurate record keeping, openness, and replication are essential for maintaining an investigator’s credibility with other scientists and society.
- S2C2P04. Explain why scientific claims may be questionable if based on very small samples of data, biased samples, or samples for which there was no control.
- S3C2P01. Propose viable methods of responding to an identified need or problem.
- S3C2P02. Compare solutions to best address an identified need or problem.
- S4C4P01. Explain how an organism’s behavior allows it to survive in an environment.
- S4C4P03. Determine characteristics of organisms that could change over several generations.
- S4C4P04. Compare the symbiotic and competitive relationships in organisms within an ecosystem (e.g., lichen, mistletoe/tree, clownfish/sea anemone, native/non-native species).
- S4C4P06. Describe the following factors that allow for the survival of living organisms:

D. Growing evidence shows that changes in many physical and biological systems are linked to human caused global warming. Some changes resulting from human activities have decreased the capacity of the environment to support various species and have substantially reduced ecosystem biodiversity and ecological resilience.

7. Climate change will have consequences for the Earth system and human lives.

E. Ecosystems on land and in the ocean have been and will continue to be disturbed by climate change. Animals, plants, bacteria, and viruses will migrate to new areas with favorable climate conditions. Infectious diseases and certain species will be able to invade areas that they did not previously inhabit.
• seed dispersal
• pollination
  Note: Beak design and protective coloration are a part of this performance objective but is not addressed in this lesson.

**AZ College and Career Readiness Standards - ELA**

**Key Ideas and Details**
- Cite specific textual evidence to support analysis of science and technical texts. (**6-8.RST.1**)
- Follow precisely a multistep procedure when carrying out experiments, taking measurements, or performing technical tasks. (**6-8.RST.3**)

**Craft and Structure**
- Determine the meaning of symbols, key terms, and other domain-specific words and phrases as they are used in a specific scientific or technical context relevant to grades 6–8 texts and topics. (**6-8.RST.4**)

**Integration of Knowledge and Ideas**
- Integrate quantitative or technical information expressed in words in a text with a version of that information expressed visually (e.g., in a flowchart, diagram, model, graph, or table). (**6-8.RST.7**)

**AZ College and Career Readiness Standards – Math**

**Mathematical Practices**

**8.MP.1.** Make sense of problems and persevere in solving them.

**8.MP.2.** Reason abstractly and quantitatively.

**8.MP.3.** Construct viable arguments and critique the reasoning of others.

**8.MP.4.** Model with mathematics.

**8.MP.5.** Use appropriate tools strategically.

**8.MP.6.** Attend to precision.

**8.MP.7.** Look for and make use of structure.

**8.MP.8.** Look for and express regularity in repeated

## Books/media:
- *Integrating climate change and genetic research to restore western landscapes* (Arboretum brochure)
- *Climate Change Is Happening...What It Is and What You Can Do* (Arboretum brochure)

## Photocopies:
- School maps (1/team)
- Ch. 8 Right Place, Wrong Time in *Climate Change from Pole To Pole* – NSTA
  - Reporting form - student page 8.1 (24 copies)
  - Consensus form - student page 8.2 (6 copies)
  - Figure 8.3 (1 copy/small group OR use document camera to present)
  - Data sets 1 through 6 (1 copy of each)
- *Phenology in Your Backyard Guide*

## Science equipment:
- Thermometer (1)
- Relative humidity meter (1)
- Light meter (1)

## Art supplies:
- White construction paper (9”x12” – 1 sheet for every student or small group)
- Colored pencils and/or markers
- White poster board (9”x12” – 1 sheet for every student or small group)

## Miscellaneous:
- Journals for students [or add to science notebooks if already being used]
- Document camera (in lieu of copies of Figures 8.1 and 8.2)
- 6 large manila envelopes
- Yardstick or measuring tape (1/team)
- Clipboards (1/team – if not using journals)
- Graph paper
- 12 plastic 1 gallon flower pots (Request from The Arboretum at Flagstaff)
- Potting soil
- Native plant seeds (Request from The Arboretum at Flagstaff)
Grade 8: Connecting Research to Outcomes in a Changing Climate

Subject & Topic
Science and ACCP – adaptations, climate change
Standards are correlated to each segment of this lesson and may be found at the end of this document.

This series of lessons for grade 8 correlates to:

Scientific and Engineering Practices
1. Asking questions (for science) and defining problems (for engineering)
3. Planning and carrying out investigations
4. Analyzing and interpreting data
5. Using mathematics and computational thinking
6. Constructing explanations and designing solutions
7. Engaging in argument from evidence
8. Obtaining, evaluating, and communicating information

Crosscutting Concepts
2. Cause and effect: mechanism and explanations
4. Systems and system models
5. Energy and matter: Flows, cycles, and conservation
6. Structure and function
7. Stability and change

Disciplinary Core Ideas
Life Sciences
LS2.A: Interdependent Relationships in Ecosystems
LS2.C: Ecosystem Dynamics, Functioning, and Resilience
LS4.B: Natural Selection
LS4.C: Adaptation
LS4.D: Biodiversity and Humans
Earth and Space Science
ESS2.C: The Roles of Water in Earth’s Surface Processes
ESS2.D: Weather and Climate
ESS3.C: Human Impacts on Earth Systems
ESS3.D: Global Climate Change

Objectives
1. Continue the study of plant phenology (initiated during grades 6 and 7) by continuing with and augmenting the previous years’ research project.
2. Explore the variety of microclimates on the school campus by investigating temperature, relative humidity, and light availability across the campus.
3. Investigate potential habitats for plants by examining the microclimates identified on the school campus and explaining their suitability for various species.

4. Understand the importance of research in helping find solutions to future climate change impacts by reviewing the role of the SEGA Project to northern Arizona’s ecological future and by examining SEGA research projects.

5. Identify how changes in the timing of plant phenology can impact animal populations by analyzing historical data of the pied flycatcher and by making inferences based upon that data.

6. Assist The Arboretum at Flagstaff by creating interpretive signs for a SEGA research project or the phenology project.

Evidence of Mastery
The following four are a continuation from grades 6 and 7 (phenology research project):

- Student log/journals/graphs kept up to date with accurate data, organized so the student may readily extract information
- Established protocols used consistently for gathering and recording data and evidence
- Frequent data collection indicated within journal/log
- Completion of required elements in the ongoing phenology study (data and evidence in journals).

Additional for grade 8:
- Collect, analyze, and chart data from a school campus investigation
- Design interpretive signs for a) an existing SEGA research project, or b) your phenology project.

Key vocabulary:
Review and reinforce vocabulary learned during Grades 6-7

Albedo Effect
Annual
Atmosphere
Biennial
Carbon cycle
Climate
Dendrochronology
Elevation
Greenhouse Effect
Greenhouse gas

- Climate Change Is Happening...What It Is and What You Can Do (Arboretum brochure)

Photocopies:
- School maps (1/team)
Phenology
Precipitation
Protocol
Qualitative data
Quantitative data
Urban heat island
Weather

Additional vocabulary for grade 8

- **Carbon footprint** - A carbon footprint is the measure of the environmental impact of a particular individual or organization's lifestyle or operation, typically measured in units of carbon dioxide (and other greenhouse gases) emitted per year.
- **Citizen Science** - is a strategy used by scientists to help augment their body of data and evidence through the training and networking of volunteers who use tested protocols for assisting in a scientific data collection.
- **Hygrometer** – a device for measuring humidity.
- **Microclimate** - the climate of a very small or restricted area, especially when this differs from the climate of the surrounding area.
- **Migration** – movement from one place to another (usually to find the best food supply and not to avoid change in temperature)
- **NDVI (Normalized Difference Vegetation Index)** – a measurement of how much photosynthesis is occurring at the Earth’s surface
- **Photometer** – a device for measuring light availability.
- **Relative humidity** - the amount of water vapor present in air expressed as a percentage of the amount needed for saturation at the same temperature.
- **Variable** – something that can vary or change

**Engage**

**Guiding question:** “How much do microclimates vary across my school campus?”
Prepare:

- Discuss different characteristics of climate and how the chosen characteristics will be measured today. Go over use of instruments and units of measure. Include in your discussion the importance of physically describing the microclimate surroundings. For example, black pavement may heat up a microclimate, whereas white concrete might cool a microclimate (Albedo Effect).
- Divide class into four teams.
- Create an 8½” x 11” perimeter map of your school campus, noting specific landmarks (streets, school building, etc.). You may choose to include a section where teams will identify date, time, weather conditions, team members, etc.
- Make copies of the map (1 copy/each team)
- Draw the outline of the school campus on the board (for share outs later in the lesson)
- Decide which group will be measuring temperature, light, relative humidity and making physical descriptions.
- Gather supplies: each group receives the appropriate “meter” and clipboards (if needed), a yardstick or measuring tape, graph paper for data collection and the map
- Calibrate thermometers (or plan to do this as a first step with students) to ensure accuracy of results [Place all thermometers into a beaker of ice water for 5 minutes. All should read between 0.0° to 0.5° C. [If there is greater variation, select one to use as your comparison point. Note how much each of the others differs and plan to incorporate that amount into final calculations.]
- As a class – choose four sites around campus, that you feel would provide optimal growing conditions for plants, to measure microclimate. Mark these sites on everyone’s map. Sites should be at least 20 feet apart.

Present:

- Ask: “Are the chosen site locations truly different microclimates? How can we find out?”
- Assign one of the chosen sites of the school campus to each team. Data should be collected on the datasheet provided.
- Ask: “What details should we include on our data sheet? To be consistent, what do we need to remember?” [Discuss the importance of all teams taking measurements at the same place within their assigned site, being sure to identify the height of the thermometer – e.g., on the ground, 6’ off the ground, etc. – and the citation of other details such as date, time, names of team members, weather conditions, etc.]

Student activity:

- Remind students of safety procedures to follow at all times while outdoors.
- In their teams, students take their measurements or make their descriptions. Provide at least 15 minutes per site. Afterwards, groups should rotate to the next site on their map and repeat the exercise until all four sites have been examined. Note: depending on the available amount of time, you may want to select campus sites that are

</tr>
</tbody>
</table>
```

Expanding the Depth and Breadth of Climate Change Common Knowledge: Using Research Gardens as a Common Thread
relatively close together.
• For those groups with meters, a reading from the instrument should be taken once every minute for a total of 10 minutes (= 10 measurements). Remind them to keep the meter in the same location for all 10 measurements.
• Back in the classroom, have students share their data. Each team should identify the highest and lowest measurement and the site description.
• Each team should create a chart, table or graph to demonstrate the variability within the data collected. Make sure that each team gets the data from the other team. Students should calculate averages.
• Ask: “Is there variation within your set of measurements for a site? Why or why not? Do your measurements across sites differ?” [Encourage answers such as shady vs. open areas, irrigated vs. non-irrigated areas, higher elevation than another, sun was shining on this spot longer than another, user error, etc.]. Repeat the question for each type of measurement and the site description.
• Explain that each of these small areas can be considered a “microclimate” or a smaller version of the Earth’s climate. Microclimates can be affected by natural events (sunshine, wind, moisture, plant cover) and by manmade factors (buildings, sidewalks, paved areas, brickwork, etc.).
• Have the groups each choose a site and summarize ALL of the collected data for that site to turn in.

Ask: “How much variation did we find across our campus? Why do you think that is the case? If the temperatures continue to rise, what responses might you expect to see in plants? In animals?”

Make sure you collect the maps and datasheets and summaries created by the student teams. (It would be helpful to scan these into a computer for future reference.)

Extension: Adding instruments like an anemometer (wind speed), soil probes (pH, moisture, temperature), and/or data loggers will provide additional scientific data that students can use in their explorations.

Explore

Guiding question: “What microclimate provides the best growing conditions for plants?”

Prepare:
• Make copies of the four-school site summaries provided by each team in the Engage activity. Randomly distribute a school site summary and map to each of the four groups.
• In their groups, have students make a list of pros and cons pertaining to plant growth relative to their group’s site summary and map. Use these lists for the following discussion on plant growth requirements.

Present:
• Ask: “Which microclimate will provide the best growing environment for plants?”
• Discuss the growing requirements of different plants. Encourage responses that include the necessities for life: food, water, shelter, space – this is also a good place to review plant adaptations.
• Explain that students will be growing native plants in the selected campus sites to determine which microclimate is best for growing plants.

**Student activity:**

• Gather the following materials and divide equally among the four groups: (12) identical 1 gallon plastic pots; (2) bags of potting soil; masking tape for labeling pots; native plant seeds*. **Note:** seeds and planting instructions can be acquired from The Arboretum at Flagstaff or can be purchased.
• Students should label each of their 3 pots with their campus location, group member names, and unique replicate number (1, 2 or 3). Afterwards, pots should be filled ¾ full with potting soil and the students should follow the planting protocol for their seeds. Discuss the importance of treating each pot the same.
• Once the seeds have been watered in – groups should place their 3 replicate pots in their microclimate site.
• ALL pots should receive the same amount of water daily – see the planting protocol for how much water this should be. Students should make observations on their pots as many times as possible per week, for up to three weeks. Most seeds should germinate in ~10 days.
• Observations should be recorded in journals. At the end of the growing period (teacher determined) – students will summarize their observations and share these data with the class.

Ask: “Which microclimate supported the highest seed germination? The least seed germination? The biggest seedlings?”

Encourage discussion as to which microclimate provided the best growing conditions.

Ask: “How would you explain the variation across microclimates?” Refer to their microclimate measures. “Did you see variation within your microclimate? What might cause this?”

Have students generate possible reasons to explain growth differences across and within microclimates.

### Explain

**Guiding question:** “What is SEGA and how is it being used to study climate change?”

**Prepare:**

• Invite a guest speaker by contacting the Director of Research at The Arboretum at Flagstaff. The Arboretum can provide a current list of SEGA researchers and help identify a speaker for your classroom. Ask the speaker to include: an overview of the SEGA Project (intended outcomes, protocols, how scientists are/will be using data),
data gathered thus far and its implications for the future, how anticipated climate change might affect plants of northern Arizona and, if known, how other species that depend upon those plants might be affected.

- Distribute the Arboretum brochure, *Integrating climate change and genetic research to restore western landscapes*

**Present:**

- Introduce the guest speaker to the class. Include a brief bio of the person’s background: special interests/hobbies, classes that helped them prepare for their career, what they enjoy about being a scientist. (You might ask the presenter to include this information prior to his/her presentation, rather than offering this information yourself.)

**Student activity:**

- Attentively listen to the presentation.
- Ask questions about SEGA and research.
- Have students work in groups to design a SEGA experiment by asking, “How would you re-design the campus study of microclimate and native plant germination and growth using SEGA?” Once the ideas are down on paper – discuss the pros and cons of each experiment as a class.

**Extension:** Plan a field trip to The Arboretum at Flagstaff to see the SEGA gardens and research projects, the state-of-the-art weather station, the Climate Change Learning Center and Exhibit.

**Elaborate**

**Guiding question:** “Right place, wrong time...or right time, wrong place?”

**Note:** The activity is adapted from the NSTA resource *Climate Change from Pole to Pole.*

**Part I**

**Prepare:**

- Review Chapter 8: “Right Place, Wrong Time – Phenological Mismatch in the Mediterranean” for background information.
- Divide class into small groups (2-5 students/group).
- Assign the following roles to each group: *note taker* (will record group’s thoughts on each data set), *timekeeper* (will monitor the time and keep group on task), *student representative* (communicates with the teacher if the group has questions), *presenter* (communicates the group’s responses to the rest of the class), *discussion leader* (optional – leads group’s discussion).
- Copy Figure 8.1 (24 copies) and Figure 8.2 (1 copy/group OR plan to use document camera)
Present:
Facilitate a brief discussion for the following:

- “What is migration? Do all birds migrate?” [movement from one place to another, usually to find a more suitable or available food source; not all birds migrate]
- “What do birds eat when they are migrating?” [whatever might be available en route!]
- “Are some foods better for birds than others? Do birds eat the same food all year long? How might plants impact the food selection of migrating birds?” [many animals eat different foods, consuming whatever might be available to them each season – e.g., squirrels, bears, coyotes all eat different foods depending on the time of year and what is in nature’s pantry]

Student activity:
- Students consider Figure 8.1. What is the “big idea” behind this diagram?
- Students then read Figure 8.2. Each group identifies 2 or more challenges that pied flycatchers might face during their spring migration.
- The presenter for each group shares its group’s ideas with the class. Facilitate a brief discussion on the collective results.

Part II
Prepare:
- Copy figure 8.3 (1 copy/group) OR use document camera

Present:
- Present figure 8.3 to the class (document camera or photocopy)
- Ask: “What is the connection between oak leaves, pied flycatchers, and caterpillars?” and “What might happen if oak leaves developed earlier than usual, well prior to the birds arrival each spring?” (This is a likely result of climate change.)

Student activity:
- Students consider the ecological and phenological connections between the oak leaf, caterpillar, and pied flycatcher in Spain.
- The presenter for each group shares key elements of its discussion with the class.
- Encourage students to try to think of other relationships between plants and other insects, birds, mammals).

Part III
Prepare:
- Prepare packets for group review: insert one data set into each of six different manila envelopes along with four copies of Student Reporting Form (Page 8.1) and one copy of Student Consensus Form (Page 8.2).

Present:
- Write the following question on the board: “Is there a relationship between high spring temperatures and the breeding success of pied flycatchers?”
- Explain to students that they will be exploring data collected by researchers in Spain over a period of 18 years. **Not all data gathered may be relevant to this question.**
- Distribute one manila packet to each group. Remind them to remain in their assigned roles while they answer all questions on their reporting form. They will have 5-10 minutes (teacher’s choice!) to consider and record their responses to the data – and only these data - in their packet.

**Student activity:**
- Each group reviews its data set within the time frame allocated and files its report in the manila envelope.
- Each envelope is passed to the next group (or groups move from table to table) and the process is repeated. **Students should NOT use any time to read a prior group’s responses. This will occur later. (Teachers may need to monitor this.)**
- Repeat three more times until each group has seen four (4) different data sets.
- Groups pass the manila packet they last considered to the next team.
- Rather than reviewing this data set and completing a Reporting Form as before, each group will review all four Reporting Sheets for the data set in their hands, consolidate the interpretations, and add details or make changes they view necessary on the Consensus Form – Page 8.2. (This may require deciding between conflicting decisions! The presenter for each group should be ready to defend his/her group’s consensus.) Additional time may be allocated to this rotation if necessary, allowing the groups time to seriously consider differences of opinion that may exist.
- Starting with data set 1, each group briefly identifies what the variables were, their relationship with each other, and (by consensus of the team) whether that data set supports, rejects, or does neither for the original hypothesis posted on the board.

Ask: “Why is it important to have both quantitative and qualitative data when considering the issue of climate change?” Facilitate a brief discussion.

Ask: “How does a warming climate impact not only a plant but also other species that depend upon that plant?”

<table>
<thead>
<tr>
<th>Evaluate</th>
</tr>
</thead>
</table>

**Guiding question:** “What can we do to help our native plants survive long-term changes in climate?”

**Part I
Prepare:**
- Work with The Arboretum liaison to gather all data collected from all classes participating in the phenological research project.
- Collect corresponding weather data from the SEGA Arboretum weather station. [http://mprlsrvr1.bio.nau.edu:8080/?command=RTMC&screen=Arboretum%20at%20Flagstaff](http://mprlsrvr1.bio.nau.edu:8080/?command=RTMC&screen=Arboretum%20at%20Flagstaff)
- Provide *Climate Change Is Happening...What It Is and What You Can Do* (Arboretum brochure) – 1 copy for every team member
Present:

• Share the aggregated phenology data and weather data with students. Ask them to create a graph, chart, or table that will begin (over time) to show trends. [This should be a visual that can be shared with the community, either via The Arboretum or classroom website or at an Arboretum kiosk. It should be presented so that any visitor to the site can easily see the research being undertaken by the students, what they are observing, and – over time – what they can infer from the data.]

Student activity:

• In teams, students create a visual (chart, graph, table) that portrays the data gathered.
• Ask: “How is the research we are doing today providing evidence that climate scientists can use 100 years from now?” Facilitate a brief discussion.
• Ask: “How do humans contribute to climate change?” [Students should refer to The Arboretum’s guide Climate Change is Happening... and recall their activities from grades 6 and 7, especially remembering how we contribute to the greenhouse effect and how carbon is moved throughout the planet and atmosphere.] Facilitate a brief discussion.
• Each student team reviews suggestions provided by The Arboretum guide. Ask: “What steps can we take now to help minimize our carbon footprint [how we are adding to climate change]? What does each of these suggestions have to do with climate change? Do you have any additional ideas or suggestions for steps we can take?” [Students may not understand that an incandescent light bulb provides 10% radiant (light) energy and 90% thermal (heat) energy when lit. CFL and LED bulbs are far more efficient! Water has a great deal of energy embedded in its delivery to us: electricity to pump raw water to be treated before it can be used for potable purposes, energy to pump the water to our homes, then back into the sewer system to be pumped to a water treatment plant, etc. It is important that students be able to draw connections between their daily activities and the resulting impacts upon the planet.]

Part II

Prepare:

• Work with Arboretum research staff to identify ongoing research projects in the SEGA gardens OR use the phenology project data to develop interpretive signs for the public.
• Gather art supplies for each student or small group.

Present:

• Explain to students that they (individually or in small groups) will be creating an interpretive sign to be displayed at The Arboretum. The purpose of this is to help the general public become more aware of the role of on-going research and the potential implications of those studies on how we manage landscapes.
• Information to be included on each interpretive sign will be: 1) The researcher(s) name and home institution, 2) the research question being addressed, 3) brief methods being used by the researcher, and 4) anticipated data and results and potential implications for land management. It will be helpful to include photos or drawings of...
the experimental design, plants being studied, and any graphs or figures that might help explain what is being done.

**Student activity:**

- Design an interpretive sign that addresses all of the listed criteria.

**AZ College and Career Readiness Standards - ELA**

**Key Ideas and Details**
- Cite specific textual evidence to support analysis of science and technical texts. *(6-8.RST.1)*
- Follow precisely a multistep procedure when carrying out experiments, taking measurements, or performing technical tasks. *(6-8.RST.3)*

**Craft and Structure**
- Determine the meaning of symbols, key terms, and other domain-specific words and phrases as they are used in a specific scientific or technical context relevant to grades 6–8 texts and topics. *(6-8.RST.4)*

**Integration of Knowledge and Ideas**
- Integrate quantitative or technical information expressed in words in a text with a version of that information expressed visually (e.g., in a flowchart, diagram, model, graph, or table). *(6-8.RST.7)*
- Distinguish among facts, reasoned judgment based on research findings, and speculation in a text. *(6-8.RST.8)*

**AZ College and Career Readiness Standards – Math**

8.MP.1. Make sense of problems and persevere in solving them.
8.MP.2. Reason abstractly and quantitatively.
8.MP.3. Construct viable arguments and critique the reasoning of others.
8.MP.5. Use appropriate tools strategically.
8.MP.6. Attend to precision.
8.MP.7. Look for and make use of structure.
8.MP.8. Look for and express regularity in repeated reasoning.

**Technology**

**Creativity and Innovation**
S1C1PO1 Analyze information to generate new ideas and products.
S1C3PO1 Identify patterns and trends to draw conclusions and forecast possibilities.
S1C4PO2 Use digital collaborative tools to analyze information to produce original works and express ideas.

**Communication and Collaboration**
S2C2PO1 Communicate and collaborate for the purpose of producing original works or solving problems.

**Digital Citizenship**
S5C2PO1 Promote digital citizenship by consistently leading by example and advocating social and civic responsibility.

Chapter 8
Right Place, Wrong Time

Phenological mismatch in the Mediterranean

Teacher Pages

AT A GLANCE

Songbirds tend to breed at the same time their primary prey is most abundant. Climate warming appears to be disrupting this match, causing reproductive failures in some species. Scientists have detected the consequences of warming for birds primarily through correlational studies. In this activity, students work in small groups and as a class to investigate “correlation versus causation.” (Class time: 1–2.5 hours)
INTRODUCTION

Migration is the seasonal movement of animals from one habitat to another. Animals must time their spring migrations to match the availability of food, territories, and mates in their breeding habitat (Ramenofsky and Wingfield 2007; Figure 8.1). Precise timing is particularly important for species that breed at high latitudes and altitudes, where summers are short and spring conditions are variable (Jonzén, Hedenström, and Lundberg 2007). Climate change appears to be compromising the ability of songbirds to synchronize migratory activities with resource availability (Parmesan 2006). Some species, like the pied flycatcher (Figure 8.2), are suffering population declines because they are not breeding when their preferred prey is most abundant (Both et al. 2006).

In this directed inquiry, small groups of students work cooperatively to examine the effects of climate change on the phenology (i.e., timing of life cycle events; see Chapter 3 for more details) of pied flycatchers. By the end of the lesson, students should be able to

- recognize that a mathematical association between two variables does not necessarily imply that one of the variables is causing a change in the other; and
- explain how different trophic levels in a food chain may respond differently to climate change.
Figure 8.1

Migrating songbirds are more successful when they match their spring arrival, breeding activities, and fall departure to resource availability.

Figure 8.2

Pied flycatcher (Ficedula hypoleuca).

Pied flycatchers are insectivorous, cavity-nesting songbirds that breed across the Palearctic (Europe, northern Africa, and northern Asia). They spend their winters in forests and savannas in west Africa, south of the Sahara Desert. Adults weigh 12–13 g. Although some flycatchers live up to seven years, adult survival each year is only 40–50% (Lundberg and Alatalo 1992). The subjects of this activity are pied flycatchers that breed in the mountains of Spain. The Spanish pied flycatchers typically arrive in early May and start laying eggs 2–26 days later (Potti 1999). Females lay one clutch of 4–7 eggs per season (Moreno et al. 1995).

Although there are no pied flycatchers in North America, we have 67 other related species. You can find your local flycatcher on eBird at http://ebird.org/ebird/eBirdReports?cmd=Start.

At left, an adult male visits an artificial nest box.

Photograph courtesy of Juan José Sanz.
TIMING IS EVERYTHING

Pied flycatchers, like most long-distance migrants, use seasonal changes in day length and an internal biological clock to initiate migration. Once en route to their breeding grounds, flycatchers may use other environmental cues to refine their behavior (Ramenofsky and Wingfield 2007). For example, cold weather along the migration route tends to slow (or even reverse) their progress north, whereas warm weather tends to accelerate it (Both, Bijlsma, and Visser 2005).

When female pied flycatchers reach their breeding grounds, they usually mate and lay eggs within one or two weeks (Potti 1999). Under the most optimal conditions, chicks will hatch when caterpillars—which are high in protein and easy to digest—are most abundant (Martin 1987). In deciduous forests where flycatchers nest, the phenology of caterpillars is synchronized with the phenology of host trees (Buse et al. 1999) (Figure 8.3). The leaves of trees such as oaks become less palatable and nutritious as they mature, so there is strong selective pressure for caterpillars to hatch at the same time tree buds break open (van Asch and Visser 2007). It appears that over the last few decades, forest caterpillars have been emerging earlier and developing faster in response to warming temperatures (Both et al. 2006).

Although some populations of pied flycatchers (e.g., in Denmark) have adjusted to changes in caterpillar phenology by advancing their spring activities, others are suffering a “phenological mismatch” with their prey (Both et al. 2004). For instance, pied flycatchers in

---

**Figure 8.3**

Synchronization of oak, caterpillar, and flycatcher phenology.

Oak buds break open in early spring

Caterpillars hatch in early spring and eat young leaves

Pied flycatchers feed caterpillars to nestlings
central Spain are breeding too late to take advantage of peak caterpillar abundance. When clutches are laid too late, parents are forced to feed chicks prey such as grasshoppers and beetles, which are lower in nutrients and likely to slow development of chicks (Wright et al. 1998). Over the last two decades, the Spanish populations of pied flycatchers have been producing fewer and lighter fledglings (young birds that can fly but are still under the care of their parents).

Furthermore, the percent of fledged nestlings that return to breed in subsequent years has declined (Sanz et al. 2003). Pied flycatcher populations that suffer long-term declines in reproductive success and recruitment (i.e., addition of new potential breeders to the population) are likely to collapse. In The Netherlands, scientists found that flycatcher populations declined by approximately 90% over 20 years in areas where caterpillar populations peaked early relative to bird breeding activity (Both et al. 2006).

Why are some flycatcher populations able to shift migration and breeding dates when others aren’t? There are several mechanisms that could account for this difference, although their relative importance is poorly understood (Pulido 2007). We list just three here. First, flycatcher populations are experiencing different regional patterns of climate change. In areas where spring warming occurs late in the season, caterpillar development is accelerated after birds are physiologically committed to breeding. Caterpillars are therefore available for a shorter period of time once chicks have hatched (Sanz et al. 2003). Second, some flycatcher populations breed in areas that experience cold snaps in early spring. When birds breed in cold weather, they have higher metabolic costs and thus less energy to invest in reproduction (Stevenson and Bryant 2000). They also are at increased risk of mortality from extreme spring weather. Therefore, there may be selective pressure against migrating too early (Pulido 2007). Third, migratory birds in poor condition are likely to arrive on breeding grounds late and start breeding late. Both climatic and nonclimatic factors that affect the body condition of birds—such as habitat fragmentation—may be overriding evolutionary changes in the timing of migration and breeding (Pulido 2007).
Figure 8.6

Changes in (A) breeding success and (B) spring temperature over time in oak forests of central Spain.

Reporting Form

Names of people in your group:

Data set # (circle one): 1 2 3 4 5 6

Describe the relationship between the two variables in the data set.

Why do you think this relationship exists?

How is this data set related to the main hypothesis? (Circle one answer.)

Supports hypothesis	Rejects hypothesis	Neither supports nor rejects hypothesis
Consensus Form

Names of people in your group:

Data set # (circle one): 1  2  3  4  5  6

Examine the completed Reporting Forms in the envelope. What is the most common interpretation of the data set?

Do you agree with this interpretation? Explain why or why not. (Hint: Think back to other data sets you looked at today.)

How is this data set related to the main hypothesis? (Circle one answer.)

Supports hypothesis  Rejects hypothesis  Neither supports nor rejects hypothesis
DATA SET 1: TIME OF LEAF DEVELOPMENT VS. YEAR IN OAK FORESTS OF CENTRAL SPAIN

Helpful hints:
- NDVI (Normalized Difference Vegetation Index) is a measurement of how much photosynthesis is occurring at the Earth’s surface. In the spring, it can be used to estimate the amount of canopy (forest covering of leaves) that has developed and when the canopy developed. If the NDVI is higher in the current year than it was at the same time the previous year, it means leaves emerged earlier in the current year.
- Caterpillars hatch at the same time leaves emerge.
- Some birds may be able to use the amount of canopy as a cue to lay eggs. However, since 1980, flycatchers in central Spain have been breeding at roughly the same time every year.
DATA SET 2: MASS OF PIED FLYCATCHER FLEDGLINGS VS. YEAR IN OAK FORESTS OF CENTRAL SPAIN

![Graph showing the relationship between fledgling mass and year.](image)

Helpful hints:
- A **fledgling** is a young bird that can fly but is still under the care of its parents.
- Lighter fledglings are more likely to die than heavier fledglings.
- Light fledglings also may have a hard time migrating south to Africa, where they spend the winter.

DATA SET 3: DATE OF PEAK CATERPILLAR ABUNDANCE VS. TEMPERATURE IN OAK FORESTS OF THE NETHERLANDS

![Graph showing the relationship between date of peak caterpillar abundance and spring temperature.](image)

Helpful hints:
- Caterpillars are leaf-eating machines. From the time they hatch from eggs, their main job is to accumulate enough energy to metamorphose into winged adults.
- Caterpillars are ectothermic ("cold-blooded"), like reptiles. The warmer their environment is, the faster they can move around, find food, eat, and grow.
- Some birds may be able to use insect abundance as a cue to lay eggs. However, since 1980, pied flycatchers in central Spain have been breeding at roughly the same time every year.
DATA SET 4: MASS OF ADULT PIED FLYCATCHERS VS. YEAR IN OAK FORESTS OF CENTRAL SPAIN

Note: Adults were weighed when their chicks were 12-13 days old.

Helpful hints:
- Adult birds use up a lot of energy when they are taking care of their chicks. If the adults are not getting enough to eat, they will lose weight.
- Males never sit on the eggs, but they help bring food to the chicks when they have hatched.
DATA SET 5: RECRUITMENT RATE OF PIELED FLYCATCHERS VS. YEAR IN OAK FORESTS OF CENTRAL SPAIN

Note: The different colored dots are from two different populations of flycatchers.

Helpful hints:
- A fledgling is a young bird that can fly but is still under the care of its parents.
- The recruitment rate is the percent of fledglings that survive the migration to and from their wintering grounds and return to breed. (Flycatchers usually breed where they were hatched.)
- Fledglings that are in good body condition before they start their first fall migration are more likely to return the following year.

DATA SET 6: SPRING PRECIPITATION VS. YEAR IN OAK FORESTS OF CENTRAL SPAIN

Helpful hints:
- Small-bodied birds are more likely to die if spring and summer weather is unusually dry and hot or unusually wet and cold.
- Adult birds may not give their chicks enough care in dry and hot conditions.
- Caterpillars may not get enough to eat during extremely dry weather because oak leaves become distasteful and hard to chew. (Imagine someone swapping out your steak for shoe leather!)

Appendix 1: Species Lists
I. What is Phenology?

“Phenology refers to key seasonal changes in plants and animals from year to—such as flowering, emergence of insects and migration of birds—especially their timing and relationship with weather and climate.” – The USA National Phenology Network

The word phenology is derived from “phenomenon”, meaning an occurrence or circumstance that can be observed. Combined with the suffix “-logy”, meaning “to study,” we arrive at our currently used term, which first dates back to the late 19th century. Using the power of observation and careful record keeping, scientists have been able to track changes in important biological events, like bird migration and bud burst, in association with changes in weather patterns. When a subject is studied over extended periods of time, and a long-term data set is developed, phenological events associated with a changing climate can be observed and tracked.

This guide focuses on plant-based phenology, but because plants cannot be separated from their animal symbionts, we also suggest observation of pollinators and pests of focal plants. Inclusion of animal associates of your focal plants is also a great way to reinforce the concepts of food chains and food webs.

II. Why Study Phenology?

Someone once said that “timing is everything,” and for the study of important phenomena like bud burst and flowering this could not be more true. Perhaps it is easiest to visualize the importance of phenology by taking a closer look at what happens when a plant’s timing is earlier or later than usual. A classic example which is frequently witnessed in Flagstaff, AZ, is the premature opening of leaf buds in the spring. Once the leaf bud breaks or bursts, the new leaf tissue is extremely vulnerable to freezing temperatures. A late frost can completely ruin a tree’s flush of leaves, requiring the tree to send out a second flush of leaves, which costs the tree valuable resources in terms of energy use. Alternately, if a tree break its leaf buds later than usual, insects that would ordinarily feed on new leaves will go hungry, consequently causing their populations to decrease, which can then affect the ability of birds to feed their hungry young.

What triggers events like bud break and flowering? The answer to this question is not simple, but typically plant phenological traits are triggered by environmental cues, specifically temperatures and moisture levels. Both temperature and precipitation are critical components of climate, thus, as our climate changes, so will the timing of these events.

Over the past century, human activities have released large amounts of carbon dioxide and other greenhouse gases into the atmosphere. Greenhouse gases act like a blanket around Earth, trapping energy in the atmosphere and causing it to warm. This is a natural phenomenon called the “greenhouse effect” and it is necessary to support life on Earth. However, the buildup of too many greenhouse gases (“enhanced greenhouse effect”) can change Earth’s climate, resulting in negative effects on human health and welfare and
ecosystem function. Right now, the south-western USA is experiencing one of the highest levels of climate change impacts in North America and has become a nexus for climate change research and study.

The study of phenology can provide important evidence that our climate is changing and reveal trends in how our environment is responding to the changing climate. For example, The U.S. Environmental Protection Agency (EPA, 2014) has identified a set of important indicators that describe trends related to the causes and effects of climate change. Among these are an index of leaf and bloom dates and documented observations in changes in the length of growing season. Anyone who has tried to grow a vegetable garden in northern Arizona knows how important length of growing season can be! Ecological studies, including phenology, often reveal disturbances in food webs.

III. USA National Phenology Network and Project BudBurst

The development of the USA National Phenology Network is credited to the U.S. Geological Survey, but many individuals and organizations have contributed to its continued growth and success, including The University of Arizona. So, what is the USA-NPN?

“The Network is a consortium of organizations and individuals that collect, share, and use phenology data, models, and related information to enable scientists, resource managers, and the public to adapt in response to changing climates and environments.” – U.S.G.S. Fact Sheet, 2011

The Network provides a very informative website (https://www.usanpn.org/node/35) that includes information on phenology indicators, educational and outreach materials, and how to become a participating Citizen Scientist. Through Nature’s Notebook (https://www.usanpn.org/natures_notebook), participating members can provide data for a national database where it will be used to make important local, regional, and even global decisions regarding environmental management.

The information and resources provided by the USA-NPN are invaluable and we highly encourage you to explore these sites prior to developing your own phenology garden.

Project BudBurst began in 2007 by folks from the National Ecological Observatory Network and the Chicago Botanic Garden with funding from the National Science Foundation. Project BudBurst aims to “Engage people from all walks of life in ecological research by asking them to share their observations of changes in plants through the seasons.” Project BudBurst operates within the broader scope of the USA-NPN, but caters to a slightly different audience. Similarly, you can find extremely helpful information on their website, http://budburst.org/home.

The websites offers species lists, from which you can choose (http://budburst.org/plantstooobserve) and also offers the option of selecting your own species to add to the database. Other features of this program are very similar to the USA-
NPN program in that they offer help with learning how to observe, provide datasheets and a database to which you can submit data, and data visualization tools, but Project BudBurst is primarily focused on plants.

IV. Planning Your Phenology Study: Design Options

The key to a successful garden, of any type, is having a plan! Prior to establishing your garden or trail, it is important to have a few concepts on paper. Begin by deciding WHO will be the garden coordinator. This person or group of people will be responsible for making sure that the plan is followed, the garden or trail is maintained, and that data are collected and stored appropriately. It is also a good idea to designate other duties, for example, who will be in charge of watering to establish the garden? Who will be in charge of weeding (if weeds are not the target organism)? And so on.

Next, decide HOW you will study phenology. Option A is to plan regular field trips to The Arboretum at Flagstaff to make observations using their established gardens. The pros of this option are that you do not need space for your own garden or resources to develop and maintain a garden, but the cons are that you need to expend resources in getting to and from The Arboretum at Flagstaff. Also, fewer observations will be made, but you might be able to examine more species. Option B is to develop a phenology garden trail. The USA-NPN website provides helpful information [https://www.usanpn.org/node/21081 about this option](https://www.usanpn.org/node/21081). Typically, a phenology garden trail will fall along a walking path (loops work nicely), and will focus on species already growing there. The pros of this option are that you can likely find a path to use on your school property or nearby and that you will minimize expenses in establishing a new garden. The cons are that you may still need to use time to travel to the path and that you will have less choice in what you observe. Option C is to develop a phenology garden. This option is the most resource intensive, but in the long run may be easier to maintain and utilize. For option C, the pros are that you will be able to walk outside your classroom and be at your study location. Your students can also take pride in helping with construction and ongoing maintenance of a school garden. The cons are that it will take some resources, including time, to develop and establish your school-based phenology garden.

If you decide to go with option B or C, then you need to decide WHERE the garden or trail will be placed. Keep the following things in mind: 1) Locate the site close as you will visit it frequently, 2) choose a uniform, representative habitat to minimize variation due to site location, 3) select a reasonable size to maintain within your available resources. Sites should not be bigger than 15 acres. And 4) make sure you have permission to establish the garden or trail. If you are establishing a garden (Option C), you want to be sure the garden area is near a water source and has good open natural light. Easy access by students and caretakers is also essential.

V. Focal Species Selection and Marking

Once you have developed a garden plan, the next step is to select the focal species for observation and mark these plants so that you know which ones to return to each
observation period. If you choose plants along a nature trail, the number of plants you select should be determined by the amount of time you want to spend making observations. For example, do you want to spend a week-long unit studying them or just a class period? If you have planted a garden, you will need to consider what species will grow well in your selected garden site and soil type. Staff at The Arboretum at Flagstaff can assist you with this process. Appendix 1 lists species taken from the USA-NPN website that can be found/grown in the Flagstaff area. For those who are outside of the Flagstaff area, we suggest looking at the species list on the USA-NPN website to choose your focal species https://www.usanpn.org/nn/species_search.

The key to any successful long-term monitoring project is making sure your plants are labeled clearly and that the labels do not come off! The Arboretum suggests using aluminum hang-tags that can wired onto a plant without hurting the plant. These tags hold up in the field environment very well, but will still need to be replaced periodically. The following website illustrates and provides pricing for the suggested tags, http://www.nationalband.com/nbtwrite.htm.

VI. Monitoring Protocols and Data Presentation

The USA-NPN website provides all of the tools that you will need to begin learning not only how to monitor but what to monitor in terms of different phenophases. We highly suggest joining Nature’s Notebook and participating in the training videos found here: https://www.usanpn.org/nn/guidelines/shared-sites. Logging your class’ data into Nature’s Notebook will provide a sense of importance to the work that has been done, and make an important contribution to a citizen science database. The website can also assist you with visualizing datasets for classroom instruction and interpretation; see the following page, https://www.usanpn.org/nn/connect/visualizations for more information.
